Prerequisites: Courses	Object oriented programming with Java
Knowledge on Fundamental Concepts	Object oriented programming basic concepts
Knowledge on Connected Tools (If any)	Linux editors

Course Learning Objectives: This course will enable the students to	
CLO1	Fundamental the concepts of Julia programming including data types, control structures, and syntax
CLO2	Explore the various structural characteristics available in Julia.
CLO3	Knowledge on tuples, dictionaries, and sets in relation to problem-solving.
CLO4	Make use of user-defined functions, packages, and file handling in Julia.
CLO5	Focus on performance enhancement through debugging, profiling, and optimization techniques in Julia programming.

SI.NO	**Experiments**
1	a. Develop a Julia program to simulate a calculator (for integer and real numbers). b. Develop a Julia program to add, subtract, multiply and divide complex numbers. c. Develop a Julia program to evaluate expressions having mixed data types (integer, real, floating-point number and complex).
2	a. Develop a Julia program for the following problem: A computer repair shop charges $100 per hour for labour plus the cost of any parts used in the repair. However, the minimum charge for any job is $150. Prompt for the number of hours worked and the cost of parts (which could be $0) and print the charge for the job. b. Develop a Julia program to calculate a person's regular pay, overtime pay and gross pay based on the following: If hours worked is less than or equal to 40, regular pay is calculated by multiplying hours worked by rate of pay, and overtime pay is 0. If hours worked is greater than 40, regular pay is calculated by multiplying 40 by the rate of pay,

	and overtime pay is calculated by multiplying the hours in excess of 40 by the rate of pay by 1.5. Gross pay is calculated by adding regular pay and overtime pay.
3	a. An amount of money P (for principal) is put into an account which earns interest at r% per annum. So, at the end of one year, the amount becomes P + P×r/100. This becomes the principal for the next year. Develop a Julia program to print the amount at the end of each year for the next 10 years. However, if the amount ever exceeds 2P, stop any further printing. Your program should prompt for the values of P and r. b. Develop a Julia program which reads numbers from a file (input.txt) and finds the largest number, smallest number, count, sum and average of numbers.
4	a. Develop a Julia program and two separate functions to calculate GCD and LCM. b. Develop a Julia program and a recursive function to calculate factorial of a number. c. Develop a Julia program and a recursive function to generate Fibonacci series.
5	a. Develop a Julia program which reads a string (word) and prints whether the word is palindrome. b. Develop a Julia program which reads and prints the words present in a file (input.txt) having Random Data in which words are dispersed randomly (Assumption: a word is a contiguous sequence of letters. A word is delimited by any non-letter character or end-of-line).
6	a. Develop a Julia program to determine and print the frequency with which each letter of the alphabet is used in a given line of text. b. A survey of 10 pop artists is made. Each person votes for an artist by specifying the number of the artist (a value from 1 to 10). Develop a Julia program to read the names of the artists, followed by the votes, and find out which artist is the most popular.
7	a. Given a line of text as input, develop a Julia program to determine the frequency with which each letter of the alphabet is used (make use of dictionary) b. Develop a Julia program to fetch words from a file with arbitrary punctuation and keep track of all the different words found (make use of set and ignore the case of the letters: e.g. to and To are treated as the same word).
8	a. Develop a Julia program to evaluate expressions consisting of rational, irrational number and floatingpoint numbers) b. Develop a Julia program to determine the following properties of a matrix: determinant, inverse, rank, upper & lower triangular matrix, diagonal elements, Euclidean norm and Square Root of a Matrix.

9	a. Develop a Julia program to determine addition and subtraction of two matrices (element -wise). b. Develop a Julia program to perform multiplication operation on matrices: scalar multiplication, element-wise multiplication, dot product, cross product.
10	a. Develop a Julia program to generate a plot of (solid & dotted) a function: y=x2 (use suitable data points for x). b. Develop a Julia program to generate a plot of mathematical equation: y = sin(x) + sin(2x). c. Develop a Julia program to generate multiple plots of mathematical equations: y = sin(x) + sin(2x) and y = sin(2x) + sin(3x).

Course Outcomes: After completing the course, the students will be able to	
CO1	Understanding of fundamental programming concepts and syntax relevant to problem-solving.
CO2	Apply appropriate programming constructs, libraries, and tools to implement solutions for problems.
CO3	Analyze the efficiency, scalability, and accuracy of solutions using different programming approaches or data structures.
CO4	Evaluate the performance of the programs through debugging, testing, and optimization techniques.
CO5	Develop software solutions or applications that integrate advanced programming concepts to address real-world or domain-specific problems.
